New high-efficiency  
tangential belts for spinning  
and twisting machines

# New high-efficiency tangential belts for spinning and twisting machines

With the new high-efficiency tangential belts, you can make even better use of your spinning and twisting machinery's potential.

They help the yarn to twist more evenly, ensure low energy consumption and reduce the noise emissions in textile machinery that operate at high speeds.

Which means your production processes are more economical.

## The Properties

## The Advantages

Q	excellent friction coating	▶	less power loss, low wear and tear and more consistent yarn twist
\$			
Q	symmetrical elastomer coating	▶	better tracking and lower noise
👂			
Q	reinforced tension member layer	▶	for reliable power transmission and maximum productivity, maintenance-free (improved tear strength and with maximum stability of the edges)
